

About Mahyu

Our primary focus is the development of a digital logistics infrastructure that provides a high-quality, interconnected network of logistics services. This system encourages SMEs, including transporters and shippers, to adopt smart devices and digital solutions, moving away from traditional methods. Our platform revolutionizes logistics by transforming services and functions through algorithm-driven processes. This enables automated operations and administration while allowing sales to expand into borderless markets without requiring significant operational or technical investments.

Partner Administration

The admin menu is specifically designed for our valued partners in each region, enabling them to manage user administration services, accounting reconciliation and customize parameters relevant to their specific area. This feature gives partners full control over administration and detailed configuration of both transporter and shipper users.

International Air Transport Integrated Methods

Domestic Land Transport Integrated Methods

Introduction:

In today's fast-paced business environment, Small and Medium Enterprises (SME) in the logistics industry encounter significant challenges when relying on sequential workflows, paper-based administration, and offline interactions.

Working with Mahyu allows you to save time and be more efficient. Gone are the days when you had to wait instruction on next task or bin location in a warehouse, nor for the driver's next pick-up or delivery details. The platform is equipped with standard logistics functions and automatically adjusts and performs its algorithm based on the service type.

Digital Logistics Platform

The System

Mahyu's open, scalable, cloud-based platform connects transporters, forwarders, and shippers—both businesses and individuals—under one integrated system. It consolidates various logistics services, including domestic land transport, international air transport, eCommerce logistics, and warehouse services, into a single platform, allowing shippers to conduct business transactions with transporters in real time.

Domestic Land Transport

This feature is designed for local transporters operating within specific regions. Transporters can provide dedicated charter services and consolidated point-to-point destinations with options for one-way or return trips. The system's automated operations make the interface user-friendly, allowing shippers to easily schedule shipments and vehicles, minimizing mistakes.

International Air Transport

Transporter users who possess a customs brokerage license can effortlessly integrate their vehicle resources during the registration process, enabling them to offer efficiently managing international air transport along with real-time online currency exchange information, pickup of both incoming and outgoing international shipments. The system identifies international shipments as a consolidated transport service, allowing users to provide both domestic and international logistics services simultaneously.

eCommerce Logistics

Mahyu has implemented a unique system for eCommerce items that directly links with the appropriate HS code for each country where we operate. By integrating HS codes with the respective duty and tax rates for destination countries, Mahyu ensures accurate and reliable customs and tax information for our users. This approach helps prevent illegal shipments, reduces the risk of complications with customs authorities, and promotes smooth and efficient international trade for all involved parties.

Warehouse Services

This feature allows shippers to evaluate and select warehouse operators based on their specific needs and the operators' qualifications. The warehouse options - whether general storage, clean rooms, or cold storage—are fully integrated with Mahyu's domestic service, ensuring seamless product distribution. For international transport, the system simplifies import-export procedures, ensuring smooth cross-border movement of goods.

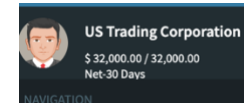

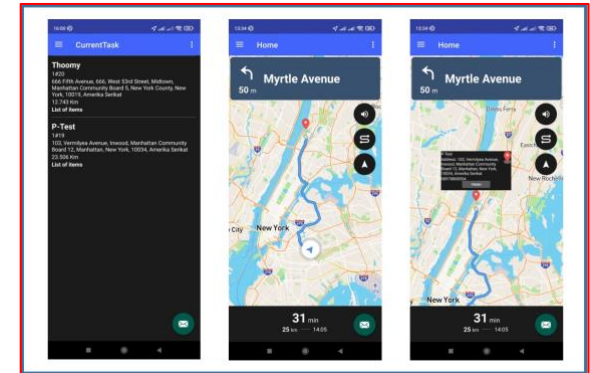

Term and Online Payment Features

Mahyu has seamlessly integrated both online and term payment systems. It automatically configures each user's payment method based on user capability during registration which reviewed by administrator. This pre-established payment system ensures that each transaction follows a standardized process, eliminating the variability of traditional methods where payment terms could vary depending on who was handling the account. It also accelerates order fulfillment and reduces unnecessary administrative processes.

Mobile Application

On the scheduled shipment date, the selected transporter's driver accesses the Mahyu mobile app, receiving operational details such as: pick-up and delivery information, mapped routes, camera activation to capture work receipts. All proof-of-receipt documents are uploaded to Mahyu's server, where both the transporter and shipper can view them in real-time.
