

Introduction

Mahyu delivers value through **four unique vertical services**, each supported by downstream linked function algorithm.

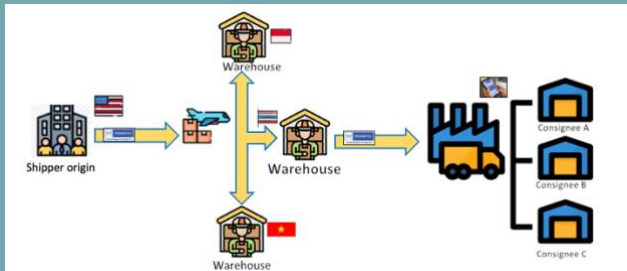

Domestic service includes consolidation and charter options, while international service provides both direct and transshipment routes. Warehouse service integrates seamlessly with domestic and international logistics, creating value-added solutions. eCommerce logistics service provides transparent and seamless individual or personal shipment with advanced payment system.

By offering these diverse categories, Mahyu generates **multi-vertical services** that address shipper supply-chain demands.

Warehouse

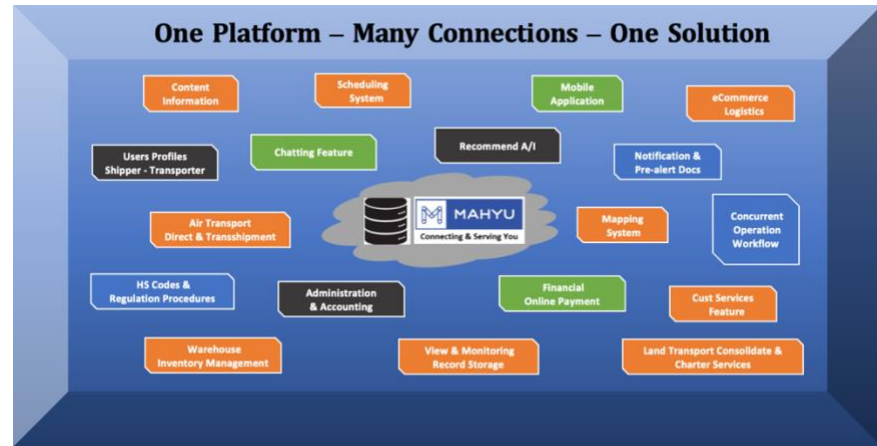

The warehouse service is divided into three categories, “general storage, clean rooms, and cold storage”, all service options are fully integrated with Mahyu’s **Domestic and International** services. This ensures a seamless flow of product distribution, whether from overseas to warehouse and to domestic market or vice versa.

One Platform – Many Connections – One Solution

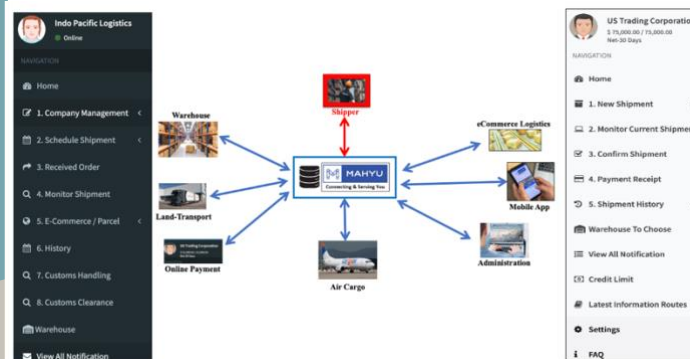

The Company: Mahyu is a technology developer, specializing in logistics platform that empowers SMEs (Small & Medium Enterprises) and industry operators by interlinking logistics services, digitizing workflows, automating back-office tasks, expanding sales and marketing into borderless markets, and consolidating financial operations.

Mahyu connects city-to-country users cluster, linking users across regions within a unified, open platform, enabling seamless, real-time collaboration under one unified-system.

Through this architecture, users in one cluster can instantly access service providers in another, all through standardized workflows and interlinked data protocols.

The System Architecture

Digital Logistics Infrastructure

Domestic Land Transport

Mahyu's domestic feature offers two service types:

- **Route service** is a consolidation service where a single vehicle provides pickup and delivery to multiple parties along a predefined route. This service is more cost-effective as it **consolidates** shipments from various customers, but may take longer due to multiple stops along the way.
- **Charter service** is a service exclusively for **one customer per shipment only**, with based calculation, on the distance between the transporter's location, the pick-up point, delivery destination, and return back to its location.

Mobile Application

This feature is integrated both with domestic and international logistics services. It provides stream line operations, automation pre-alert, the application is activated on schedule shipment dates which offers the following features: navigation support, real-time tracking, digital receipts, information sharing, assist domestic and international air transport; inbound and outbound.

eCommerce Logistics

The core component of this feature is the integration of item lists mapped to their corresponding HS codes, along with *destination-specific duty and tax rates*. These charges are automatically combined with last-mile delivery costs, creating a complete end-to-end pricing structure. The system then connects directly to an online payment gateway, enabling shippers *to settle all charges in advance*. To operate effectively, this feature requires prior coordination between the forwarders at both the origin and destination.

International Air Transport

Mahyu has developed two dynamic international routing options-Direct and Transshipment. The **Direct Route** connects port-to-port seamlessly, while the **Transshipment Route**, combination of two direct flights operate through port-hub-port connections. Shippers can easily choose their preferred option through an intuitive selection menu, making import & export simpler than ever before.

With Mahyu's system, shippers can input their requirements and **instantly view, analyze and select** from available transporters, *eliminating* the traditional manual process of "negotiating, comparing value, and assessing services". Once a transporter is selected, the system instantly handles back-end **confirmation** to transporter-forwarder, streamlining workflows, reducing traditional processing times from **days to just hour**, benefiting all parties involved.

Term and Online Payment

Mahyu's logistics ecosystem is designed to support both **term-based** and **online payment** systems, providing to the needs of both Business and Consumer users. The system assigns a payment method for each user based on an assessment conducted during the registration process by **our partner administrators**. The payment methods include:

- **Term Payment:** Dedicated to qualified business users for domestic transport, international logistics, and warehouse services.
- **Online Payment:** Tailored for individual and consumer users, particularly those utilizing eCommerce logistics services. The system facilitates seamless transactions through standard credit card payments or mobile banking options specific to each country.
